

Quad Strength Trimeth Sulfa s/p I&D Abscess

What's a Modified Intention to Treat Trial?

- Can exclude participants after randomization
 - e.g. eliminate non-compliant patients (bias?)

Of note:

close to half were MRSA and many had MRSA suspicious abscess

only 64% adherence to the 7 day regimen

Needed to take 75% of study drug to be considered in the per protocol group

Bottom line 7% difference in cure rate (93% v 86%)

no change in rare invasive infection (<1%)
